

Simplify Payment for Multiple Shipment Orders with Split Capture for E-Commerce

Collect individual payments across multiple shipments from a single authorization-only transaction

What is Split Capture?

Split Capture is an online payment tool that benefits e-commerce retailers and wholesalers who fulfill orders in multiple shipments. With Split Capture, merchants can capture multiple payments from a single authorization-only transaction as they fulfill each shipment in their customer's order. This enables them to authorize the estimated or total transaction amount and then capture it in increments as portions of the order are fulfilled.

Benefits of Split Capture

Gain more control over your payment processing flow

Split Capture gives you more control over when funding should be initiated, allowing you to manage payments for complex shipment schedules with ease.

Improve your customer's experience

Rather than capturing the entire authorization amount upfront and surprising your customers with a substantial charge for orders they haven't yet received, Split Capture allows you to capture payment for the amount that was shipped.

Keep your records organized

By capturing payments when shipments go out, your transactions will better reflect your shipments – which means more accurate records, less upkeep, and less time spent tracing fulfillments and invoices.

Even More Cardknox E-Commerce Features
